

Goodwill Continues Going & Saving Green!

Exactly 5 years ago, we upgraded the lighting to LED's at the Goodwill of Western & Northern CT stores, which offered an immediate savings and a nice new look. Earlier this year, things were taken a step further, upgrading their HVAC (Heating/Ventilation/Air Conditioning) systems to the latest & greatest in smart technology.

Until now, most of their RTU's (Roof Top Units) were only capable of being either "on" or "off", sort of like a 2-way switch. Recently, we added ARC's (Advanced Rooftop Controls) to their HVAC systems, allowing for a variable speed option (like a dimmer switch), which will greatly decrease the run cost, and reduce the wear & tear on the units.

According to CFO Jerry Segrue: "This project offered immediate savings, over 60% incentives, and 0% financing. This, along with a very nice Return on Investment made it a home-run for Goodwill!"

Non-Profits Can Get Tax Incentives w/Solar Solutions!

For years, CT non-profits were unable to take advantage of the huge tax savings incentives for upgrading to a solar photovoltaic solution... until now!

Thanks to the recently passed Inflation Reduction Act, even though most non-profits do not pay taxes, they are now able to get a large piece of the total cost of solar covered through tax incentives.

So what does this really mean? Any organization that has tax-exempt status can receive a direct payment for 30% of the total solar energy system installation costs, which simply makes things more affordable. This extra incentive can subtract thousands of dollars off the price for a solar array, which in turn could drastically improve the Return on Investment!
