

## Emendee Tech Has Partnered with GoNetSpeed

Back in the days of dial-up Internet (remember those annoying tones?!), speeds of 56K (56,000 bits per second) were fantastic. Cable modems and DSL (Digital Subscriber Line) were the next phenomenon, with speeds starting in the “M’s” (Millions of bits per second), but upload speeds (sending out information, such as data back-ups, videos, etc.) were much slower than download speeds (receiving information, such as emails & website content), and reliability has wavered in the past few years.

Until now, Internet over Fiber has been priced out of reach for many CT customers. However, since 2018, GoNetSpeed has been building a fiberoptic network across the state, connecting many customers to a robust & reliable Internet service at speeds in the Billions of bits per second!

GoNetSpeed offers many different symmetrical (uploads & downloads are both super-fast) Internet speeds over Fiber... from as low as 500M and all the way up to to 10G! But GoNetSpeed isn’t available everywhere quite yet. If you’d like to know if it’s available near your business, contact us today!

## Client Highlight: St. Bernard School in Enfield

St. Bernard Catholic School, which is part of the St. Jeanne Jugan Parish (a long-term Emendee client) had some issues with their outdated Nortel phone system over the past few years. They reached out to us, and a temporary solution was implemented.

A few months later, an entirely new Hosted Phone System was offered, accepted & installed. The new Hosted Phone System comes with unlimited remote support, so all phone system remote changes and updates are taken care of.

An energy upgrade was also implemented, offering immediate savings through utility incentives (along with 0% financing). This goes along nicely with their fixed electricity supply agreement through Emendee.

According to the Principal, Charlene Mongillo: “I am very satisfied with the results of both the lighting & hosted phone system installations!”
